Exploring the Future of Medical Education: AI Chatbots as Future Pedagogy
Varna Taranikanti M.D.; Ph.D. & Cameron J. Davidson Ph.D.

Introduction
- Education has consistently been evolving alongside the advent of new technologies
- Recent advancements such as AI will have an exponentially large impact on society and the domain of education will be no different.
- Working with the next generation who are digital natives will necessarily include technology for them and their future
- Educational experiences that are active, contextual, integrated and student-owned leads to deeper learning.
- Major contemporary challenges facing medical education include but is not limited to
  - Student to faculty ratio
  - Short attention spans and rote learning
  - Peer engagement – relying on the skilled other
  - Engagement of metacognitive skills

Aims and Objectives
- **Main Aim**: Develop students into independent lifelong learners by developing Higher Order Thinking [HOT] skills through metacognition
- **Objectives**:
  - Create an AI Chatbot for self-paced learning and developing HOT skills
  - Discuss how AI chatbots can promote active learning and metacognitive skills
  - Identify the challenges in creating the AI Chatbot

Expected Results
- Future students will be able to better navigate the complexities inherent in the medical field
- Engage with complex material at a deeper level
- Utilize the in-built scaffolding the AI chatbot provides to develop nascent knowledge for lifelong learning
- Interacting with the AI Chatbot is akin to a virtual facilitator
- Occurs in a safe and self-paced learning environment

Discussion
- The next generation of medical students are digital natives and and AI Chatbot meets their learning preferences and needs
- Chatbots positively impact student engagement, learning outcomes, and educational experiences
- Collaboration with experts and utilization of appropriate AI tools helps avoid common mistakes (e.g. hallucinations)
- Integration of asynchronous, self-paced, and iterative AI Chatbots will likely result in more personalized and adaptive learning among medical students.

Approach and Evaluation Plan

Expected Results
- Future students will be able to better navigate the complexities inherent in the medical field
- Engage with complex material at a deeper level
- Utilize the in-built scaffolding the AI chatbot provides to develop nascent knowledge for lifelong learning
- Interacting with the AI Chatbot is akin to a virtual facilitator
- Occurs in a safe and self-paced learning environment

Discussion
- The next generation of medical students are digital natives and and AI Chatbot meets their learning preferences and needs
- Chatbots positively impact student engagement, learning outcomes, and educational experiences
- Collaboration with experts and utilization of appropriate AI tools helps avoid common mistakes (e.g. hallucinations)
- Integration of asynchronous, self-paced, and iterative AI Chatbots will likely result in more personalized and adaptive learning among medical students.
